Tech Huddle

Webpack

Just another Module Bundler or ...

Tech Talk

Focus

What is Webpack?

The role it plays and how can we harness its “power” for good?

And some other small tricks to make life easier!

Webpack ...

- ✓ ... is a Static Module Bundler
- ✓ ... serves Modern JavaScript applications
- ✓ ... supports the Modular Programming Software Design technique
- ✓ ... builds a Dependency Graph from an entry point
- ✓ ... bundles needed modules into static assets

Modular Programming

“Separating the functionality of a program into independent, interchangeable modules, such that each contains everything necessary to execute only one aspect of the desired functionality”

Benefits

Smaller Surface than a full program makes verification, debugging, and testing easier, and less complex.

Other bundlers

In the world there is always more ...

- ✓ Vite
- ✓ Browserify
- ✓ FuseBox
- ✓ Rollup
- ✓ Parcel
- ✓ ...

Webpack modules

Webpack supports ...

- ✓ ECMAScript modules (ESM)
- ✓ CommonJS modules
- ✓ AMD modules
- ✓ Assets
- ✓ WebAssembly modules

Webpack modules

Express dependencies using ...

- ✓ An ES2015 **import** statement
- ✓ A CommonJS **require()** statement
- ✓ An AMD **define** and **require** statement
- ✓ An **@import** statement inside of a css/sass/less file
- ✓ An image url in a stylesheet `url(...)` or HTML ``

Webpack

Core Concepts

These are the core concept worth knowing ...

- ✓ Entry
- ✓ Output
- ✓ Loaders
- ✓ Plugins

There are two more that we will skip for now ...

- ✓ Mode
- ✓ Browser Compatibility

Entry

An entry point indicates which module webpack should use to begin building out its internal dependency graph

Output

An entry point indicates which module webpack should use to begin building out its internal dependency graph

Loaders

Out of the box, webpack only understands JavaScript and JSON files. Loaders allow webpack to process other types of files and convert them into valid modules that can be consumed by your application and added to the dependency graph

Plugins

While loaders are used to transform certain types of modules, plugins can be leveraged to perform a wider range of tasks like bundle optimization, asset management and injection of environment variables

LOADERS

LOADERS

“Making Webpack your own”

- ✓ Transformations applied to the source code of a module
- ✓ Allow to pre-process files when “import” or “load” them
- ✓ Work as Tasks in other build tools
- ✓ Handles front-end build steps

A Loader ...

- ✓ ... is a Node module that exports a function
- ✓ ... has access to the Loader API through "this" context
- ✓ ... takes a single parameter that is passed a string containing the content of the resource file
- ✓ ... can be synchronous that will return a single value representing the transformed module

A collection of various guitar pedals, including a blue Big Sky, a grey EarthQuaker, and a black GFI, are arranged on a dark surface. A coiled cable is visible in the upper right corner.

Loaders ...

- ✓ ... can be chained.
- ✓ ... are executed in reverse order in a chain
- ✓ ... results are passed as an argument to the next in the chain
- ✓ ... last in a chain is expected to return JavaScript
- ✓ ... can be synchronous or asynchronous
- ✓ ... runs in Node.js
- ✓ ... can emit additional arbitrary files

Loaders are executed individually

PLUGINS

Plugins ...

- ✓ ... are the backbone of Webpack
- ✓ ... system is used internally in Webpack
- ✓ ... do everything else that Loaders cannot do
- ✓ ... are added and configured in `webpack.config.js`
- ✓ ... can also be added through the Node API

A Plugin ...

- ✓ ... is a JavaScript Object
- ✓ ... object has one method, apply
- ✓ ... is initialized by Webpack by calling the apply method in the initialization
- ✓ ... has access to the entire compilation lifecycle

“While loaders are used to transform certain types of modules, plugins can be leveraged to perform a wider range of tasks like bundle optimization, asset management and injection of environment variables.”

Webpack

Webpack provides a lot out of the box

<https://webpack.js.org/plugins>

<https://webpack.js.org/awesome-webpack/#webpack-plugins>

How to Hook into Webpack

Plugin API

Provides access to all parts of the Webpack lifecycle through tapable hooks.

Tapable

Small package built by Webpack

Many objects in Webpack extends the Tapable class

Tapable expose Hook classes

Through “tap” you can attach a hook to different parts of Webpacks lifecycle

Tapables

- ✓ SyncHook,
- ✓ SyncBailHook,
- ✓ SyncWaterfallHook,
- ✓ SyncLoopHook,
- ✓ AsyncParallelHook,
- ✓ AsyncParallelBailHook,
- ✓ AsyncSeriesHook,
- ✓ AsyncSeriesBailHook,
- ✓ AsyncSeriesWaterfallHook

Hooks

Reporting Progress

The moral of the story is that there are

- ✓ Compiler Hooks
- ✓ Environment
- ✓ ...

- ✓ Compiler Hooks
- ✓ Module
- ✓ rebuildModule
- ✓ ...

- ✓ Context Module
- ✓ Parser Hooks

- ✓ NormalModuleFactory Hooks

- ✓ Custom Hooks

Nowadays

To report progress, a plugin must tap into a hook using the context: true option.

reportProgress

It is possible to customize the printed output by passing different arguments to the function of ProgressPlugin.

plugins can report progress via ProgressPlugin, which prints progress messages to stderr by default. In order to enable progress reporting, pass a --progress argument when running the webpack CLI.

compiler.hooks.run.tapAsync('MyPlugin', (source, target, routesList, callback) => { console.log('Asynchronously tapping the run hook...'); return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook with a delay...'); }); });

compiler.hooks.run.tapPromise('MyPlugin', (source, target, routesList) => { return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook...'); }); });

compiler.hooks.run.tapAsync('MyPlugin', (source, target, routesList, callback) => { console.log('Asynchronously tapping the run hook...'); return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook with a delay...'); }); });

compiler.hooks.run.tapPromise('MyPlugin', (source, target, routesList) => { return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook...'); }); });

compiler.hooks.run.tapAsync('MyPlugin', (source, target, routesList, callback) => { console.log('Asynchronously tapping the run hook...'); return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook with a delay...'); }); });

compiler.hooks.run.tapPromise('MyPlugin', (source, target, routesList) => { return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook...'); }); });

compiler.hooks.run.tapAsync('MyPlugin', (source, target, routesList, callback) => { console.log('Asynchronously tapping the run hook...'); return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook with a delay...'); }); });

compiler.hooks.run.tapPromise('MyPlugin', (source, target, routesList) => { return new Promise((resolve) => setTimeout(resolve, 1000)).then(() => { console.log('Asynchronously tapping the run hook...'); }); });

Demo

Why Scaffolding?
